

Analyzing LinkedIn Top Skills dataset in Tableau

- 1- Cloud and distributed computing is number one skill globally and in most advanced countries, it is not surprising as this skill is very important today as it is very important in next generation technologies like self-driving cars.

2- Comes next, Statistical analysis and data mining, this skill is very important, all businesses need data specialist that can get insights out of data to build marketing campaigns and control product specifications and other important aspects in any business. China and India are less ranked, China is more into Networking and Information Security and India is more into User interface design and storage systems.

3- Surprisingly, SEO/SEM marketing has reduced. I guess that's not because the reduced importance of the skill itself, but because that most people learn this skill so need for the skill has reduced.
